**Cameco Proceeds with Cigar Lake Mine Construction**

Saskatoon, Saskatchewan, Canada, December 21, 2004 . . . . .

**Cameco Corporation** announced today that the Cigar Lake joint venture has decided to proceed immediately with construction at the Cigar Lake project. This is the world’s second largest, high-grade uranium deposit after McArthur River.

Cameco operates Cigar Lake on behalf of a joint venture consisting of Cameco (slightly larger than 50%), COGEMA Resources Inc., a subsidiary of AREVA (37%), Idemitsu Uranium Exploration Canada Ltd. (8%) and TEPCO Resources Inc. (5%). On December 20, 2004, the Canadian Nuclear Safety Commission (CNSC) announced that it had approved a construction licence for Cigar Lake located about 660 kilometres north of Saskatoon.

We are excited about bringing Cigar Lake uranium into an expanding market that reflects a renewed worldwide interest in nuclear energy, said Jerry Grandey, Cameco’s president and chief executive officer. After many years of waiting, we are now confident the long-term market fundamentals support our decision to invest in a large uranium development.

This market outlook is shared by a number of Cameco’s international customers who have entered into longer-term contracts with Cameco for a significant amount of future Cigar Lake production.

Cameco anticipates construction will begin early in 2005 and take approximately 27 months to complete. Production could begin in 2007 followed by a rampup period of up to three years before the mine reaches full production of 18 million pounds per year.

In making the development decision, the Cigar Lake joint venture approved a construction budget of about \$450 million (Cameco’s share is \$225 million) that includes surface and underground facilities at Cigar Lake as well as changes to the milling facilities at McClean Lake and Rabbit Lake. Cameco expects to fund its share of construction costs with operating cash flow and debt.

Initially Cigar Lake ore will be processed at the mill located at Cogema’s McClean Lake operation, 70 kilometres to the northeast. As Cigar Lake production ramps up to full capacity, just over half of final uranium processing will be completed at Cameco’s Rabbit Lake mill facility, pending regulatory approval.

**Table of Contents**

During construction, a maximum of about 350 workers will be employed at the Cigar Lake site. Approximately 250 people will be permanently employed after production begins.

The Saskatchewan government recognizes the significant social and economic benefits of this project and has expressed its willingness to encourage new production, such as Cigar Lake, in a fashion similar to what has been done for other resource sectors in the province.

The Cigar Lake deposit was discovered in 1981. Test mine development began in 1987 and was completed in 2000. An environmental impact statement was filed with the relevant regulatory authorities in 1995. After a thorough environmental assessment, in April 1998 the federal and provincial governments accepted the recommendations of a joint-review panel and authorized the project to proceed to the regulatory licensing stage. In 2003, a further screening level environmental assessment was required by regulation before construction and operating licences could be issued. In February 2004, the environmental assessment study report was filed and accepted by the CNSC in July 2004 allowing the project to proceed to construction licensing.

Cameco, with its head office in Saskatoon, Saskatchewan, is the world's largest uranium producer. The company's uranium products are used to generate electricity in nuclear energy plants around the world, providing one of the cleanest sources of energy available today. Cameco's shares trade on the Toronto and New York stock exchanges.

Statements contained in this news release which are not historical facts are forward-looking statements that involve risks, uncertainties and other factors that could cause actual results to differ materially from those expressed or implied by such forward-looking statements. Factors that could cause such differences, without limiting the generality of the following, include: volatility and sensitivity to market prices for uranium, electricity in Ontario and gold; the impact of the sales volume of uranium, conversion services, electricity generated and gold; competition; the impact of change in foreign currency exchange rates and interest rates; imprecision in reserve estimates; environmental and safety risks including increased regulatory burdens; unexpected geological or hydrological conditions; political risks arising from operating in certain developing countries; a possible deterioration in political support for nuclear energy; changes in government regulations and policies, including trade laws and policies; demand for nuclear power; replacement of production and failure to obtain necessary permits and approvals from government authorities; legislative and regulatory initiatives regarding deregulation, regulation or restructuring of the electric utility industry in Ontario; Ontario electricity rate regulations; weather and other natural phenomena; ability to maintain and further improve positive labour relations; operating performance of the facilities; success of planned development projects; and other development and operating risks.

Although Cameco believes that the assumptions inherent in the forward-looking statements are reasonable, undue reliance should not be placed on these statements, which only apply as of the date of this report. Cameco disclaims any intention or obligation to update or revise any forward-looking statement, whether as a result of new information, future events or otherwise.
