Form 6-K
October 30, 2013

FORM 6-K

SECURITIES AND EXCHANGE COMMISSION
Washington, D.C. 20549

Report of Foreign Issuer

Pursuant to Rule 13a-16 or 15d-16 of
the Securities Exchange Act of 1934

For the month of October 2013

Commission File Number: 001-11960

AstraZeneca PLC

2 Kingdom Street, London W2 6BD

Indicate by check mark whether the registrant files or will file annual reports under cover of Form 20-F or Form 40-F.
Form 20-F Form 40-F

Indicate by check mark if the registrant is submitting the Form 6-K in paper as permitted by Regulation S-T Rule 101(b)(1): _____

Indicate by check mark if the registrant is submitting the Form 6-K in paper as permitted by Regulation S-T Rule 101(b)(7): _____

Indicate by check mark whether the registrant by furnishing the information contained in this Form is also thereby furnishing the information to the Commission pursuant to Rule 12g3-2(b) under the Securities Exchange Act of 1934.

Yes No

If "Yes" is marked, indicate below the file number assigned to the Registrant in connection with Rule 12g3-2(b):
82-_____

ASTRAZENECA ADVANCES MEDIMMUNE'S BENRALIZUMAB
TO PHASE III IN SEVERE ASTHMA

AstraZeneca today announced the start of the Phase III Windward programme for benralizumab, a potential treatment for severe uncontrolled asthma developed by MedImmune, the company's global biologics research and development arm. The goal of CALIMA, the first study in the Windward programme, is to determine whether benralizumab reduces the number of exacerbations in patients with severe asthma that remains uncontrolled, despite receiving high doses of inhaled corticosteroids in combination with a second controller such as a long-acting beta agonist.

Benralizumab is a monoclonal antibody binding to the interleukin-5 receptor (IL-5R) that depletes eosinophils, a type of white blood cell, which play a critical role in the cause and severity of asthma and asthma exacerbations. Emerging evidence shows that for patients with elevated eosinophil counts, treatment with an IL-5 inhibitor in addition to guideline-based strategies may improve their asthma control and decrease the frequency of asthma attacks.

"We are pleased to begin the Phase III trial programme for benralizumab and advance innovative research in respiratory disease, a core therapy area for AstraZeneca," said William Mezzanotte, Vice President and Head of Respiratory & Inflammation and Neuroscience in AstraZeneca's Global Medicines Development unit. "The development of benralizumab underscores our commitment to addressing and ultimately changing the course of chronic respiratory diseases through targeted and personalised treatment. Benralizumab has the potential to address an important area of unmet medical need as there are currently limited treatment options available for patients with severe uncontrolled asthma."

The CALIMA trial will evaluate the safety and effectiveness of benralizumab in actively reducing exacerbations in patients with uncontrolled asthma. The study will also assess the effect of benralizumab on lung function, asthma symptoms and other asthma control measures, as well as emergency room and hospitalisation rates due to asthma. Trial participants will be classified in the trial based on blood eosinophils measured through a simple blood test. They will be administered benralizumab subcutaneously via a pre-filled syringe.

Initiation of this trial is based on results from the Phase IIb asthma study, conducted by MedImmune, which showed that patients with elevated eosinophils on benralizumab had a statistically significant reduction in exacerbation rate compared to placebo, as well as improvements in lung function and asthma symptoms. The efficacy and safety data from this trial supported the progression of benralizumab into our Phase III programme. These results are expected to be shared at a scientific conference in the first half of 2014.

In addition to CALIMA, the Windward programme will include two pivotal exacerbation trials for benralizumab added to high- (SIROCCO) or medium- (PAMPERO) dose inhaled corticosteroids plus a long-acting beta agonist; an oral corticosteroid-reducing trial (ZONDA); and a long-term safety trial (BORA). These trials are designed to provide additional information about benralizumab in patients with severe uncontrolled asthma.

Benralizumab is in-licensed from BioWa, Inc., a wholly-owned subsidiary of Kyowa Hakko Kirin Co., Ltd. Under the exclusive license agreement, Kyowa Hakko Kirin/BioWa have exclusive development and commercialisation rights for benralizumab in Japan and certain countries in Asia. AstraZeneca has exclusive rights for benralizumab in all other countries including the US and Europe. BioWa is eligible for milestone payments and royalties related to the development and commercialisation of benralizumab in those countries.

NOTES TO EDITORS

About Benralizumab

Benralizumab is a monoclonal antibody directed at the alpha subunit of the interleukin-5 receptor (IL-5R) that depletes eosinophils, a key target cell in inflammatory respiratory disease. Scientific literature supports that eosinophil count is associated with exacerbations and increased eosinophils are associated with frequent exacerbations.

An estimated 5 to 10 per cent of the 300 million people worldwide who suffer from asthma have a severe form, and people with eosinophilic airway inflammation represent approximately 40 to 60 per cent of the severe asthmatic population.

About MedImmune

MedImmune is the worldwide biologics research and development arm of AstraZeneca. MedImmune is pioneering innovative research and exploring novel pathways across key therapeutic areas, including respiratory, inflammation and autoimmunity; cardiovascular and metabolic disease; oncology; neuroscience; and infection and vaccines. The MedImmune headquarters is located in Gaithersburg, Md., one of AstraZeneca's three global R&D centers. For more information, please visit www.medimmune.com.

About AstraZeneca

AstraZeneca is a global, innovation-driven biopharmaceutical business that focuses on the discovery, development and commercialisation of prescription medicines, primarily for the treatment of cardiovascular, metabolic, respiratory, inflammation, autoimmune, oncology, infection and neuroscience diseases. AstraZeneca operates in over 100 countries and its innovative medicines are used by millions of patients worldwide. For more information please visit: www.astrazeneca.com.
